## Abstract of JP 11161793 (A)

**PROBLEM TO BE SOLVED:** To prevent illegal access to a computer by collating a fingerprint which is read with fingerprint information of an IC card and transmitting individual information containing a collation result and fingerprint information which is read to the computer. **SOLUTION:** The fingerprint inputted by an IC card read part 2-1 and a fingerprint read part 2-2 from a user is collated with fingerprint information of the IC card by a fingerprint collation part. When a collation result is matched, inputted fingerprint information and individual information of a user, which is stored in the IC card, are transmitted from A terminal 1 to a server 3. Individual information which the server 3 receives by an access judgment part 3-1 is collated with information of a data base 4 and the propriety of the use of the computer 3 is judged. When a result obtain by collating the fingerprint with fingerprint information of the IC card is not matched in the terminal 1, effect that the computer cannot be used 3 is displayed to the user of the terminal 1. When individual information is not transmitted to the server 3, a load against a network and the server 3 is reduced.
